

Fedora 11 Live USB

Congratulations, you've got the future of open source in a rugged, portable USB key. Your key contains Fedora, a complete, bootable operating system. Plug it in, power up, and try it out. You can even make changes as you go to make Fedora suit your needs.

Live USB Quick Start

- Turn off your computer and insert the USB key into an open slot.
- Turn the computer on, and hit the appropriate key for a boot menu or BIOS setup. Usually this is F12, F1, or Esc. (Your computer's manual will tell you which one.)
- Set the computer to boot from the USB device, and save/exit if needed.
- A blue background appears and after a short delay Fedora starts booting. Enjoy.

Did You Know?

- Thanks to a feature called *persistence*, you can make changes to this USB-based Fedora system. You can download new software, install security updates, and store documents and other data.
- The Fedora Project has thousands of additional free software packages for everything from entertainment, to software development, to productivity tools, maintained by our many volunteers.
- Anyone is welcome to join Fedora and work with our talented community on design, infrastructure, development, translation, documentation, marketing, and much more.

More About Your Live USB Key

This key is designed to boot on most Intel or AMD compatible personal computers, including 32- and 64-bit processors. This key cannot be booted on a PowerPC based computer such as an older Apple Macintosh system.

If you have problems...

- The Fedora Project maintains a listing of known problems on its public wiki:
